

Peckham, G. W. & E. G. Peckham. 1903. New species of the family Attidae from South Africa, with notes on the distribution of the genera found in the Ethiopian region.

Trans. Wiscons. Acad. Sci. Arts Let. 14: 193.

*Heliophanus modicus* sp. nov.

Plate XX, fig. 2.

♀. Length 5 mm. Legs  $43\overline{12}$ .

The ground color is black on the cephalothorax, brown on the abdomen. The cephalothorax has white bands low down on the sides, while the upper surface seems to have been thinly covered with yellowish-white hairs. The rings around the eyes of the front row are white. The abdomen has a wide herring-bone stripe and an encircling band, white. The legs and palpi are pale brown. The falces are weak and vertical, and dark brown in color. The very narrow clypeus is marked by a white line.

We have several females from Algoa Bay and Durban.
