

Pocock, R. I. 1898. Descriptions of three new species of spiders of the genus *Selenops*. Ann. Mag. nat. Hist. (7) 2: 349.

*Selenops vigilans*, sp. n.

Coloured as in *S. radiatus*, which it closely resembles structurally, with the same spine-armature of the first and second leg—that is to say, with three pairs of spines on the underside of the tibiæ and two pairs on the protarsi; but the posterior median eyes are larger as compared with the anterior medians, are much closer to them and form a more strongly recurved line; the posterior lateral eyes are also larger and more prominent.

*Vulva* very different from that of *S. radiatus*, the lateral lobes being widely separated behind by a prolongation of the median sclerite (fig. 2).

*Measurements in millimetres*.—Total length 14; length of carapace 6.2, of first leg 20, of fourth leg 21.

*Loc.* Giriama, near Fuladoya, Masailand (*J. W. Gregory*).
